

AETHER

Digital SaaS Platform

FINAL COMPANY DESIGN BRIEF

Front-End Implementation Assessment

PROJECT AETHER SaaS Website	ROLE Front-End Developer
STACK HTML5 + CSS3	PROHIBITED JavaScript, Bootstrap, Tailwind, CSS frameworks/libraries

Objective: build a professional, responsive 3-page SaaS website that demonstrates production-level HTML/CSS skills, semantic structure, Flexbox, responsive behavior, forms, validation, and CSS architecture.

01 — COMPANY BRIEF

Context

AETHER is a SaaS platform for companies that need to manage projects, teams, analytics, workflows, automation, security, integrations, and reporting in one digital operation.

Assignment

You are joining the front-end team as a developer responsible for translating this brief into a polished responsive website. The assessment is intentionally implementation-focused: visual quality must be achieved with HTML and CSS only.

Deliverables

- index.html — Home
- platform.html — Platform
- contact.html — Contact
- css/reset.css — CSS reset
- css/style.css — main stylesheet
- assets/images/ — image assets
- assets/icons/ — icon assets

Technical contract

- Required: HTML5, CSS3, semantic HTML, Flexbox, Responsive Design, Media Query, CSS variables, pseudo-classes, pseudo-elements, HTML forms, HTML validation.
- Prohibited: JavaScript, Bootstrap, Tailwind, CSS frameworks, CSS libraries.
- Do not solve body overflow by hiding it with `body { overflow-x: hidden; }`. Fix the actual layout cause.
- CSS must be separated from HTML. Keep reset.css separate from style.css.

02 — PAGE 01 / HOME

Visual direction: premium B2B SaaS, clean spacing, strong typography, dashboard-led hero, restrained blue accent.

[illegible]

Required sections

- Hero: BUILD. SCALE. DOMINATE. + dashboard visual.
- Trusted by Innovative Teams: NOVA, VERTEX, ORBIT, QUANT, LUMA.
- Six services: Analytics, Workflow, Automation, Security, Integrations, Reporting.
- Three alternating feature sections: IMAGE | CONTENT, CONTENT | IMAGE, IMAGE | CONTENT.
- Statistics: 10K+ USERS, 98% UPTIME, 4.9 RATING, 24/7 SUPPORT.
- Footer with Platform, Company, Resources, and Legal groups.

Implementation questions

Q1. How will flex-grow, flex-shrink, and flex-basis divide the hero between content and dashboard?

Q2. How will flex-wrap allow the trusted-company logos and service cards to reflow without assigning card counts through Media Query?

Q3. How can one HTML structure create alternating feature layouts using CSS rather than section1/section2/section3 classes?

03 — PAGE 02 / PLATFORM

Page flow

Feature navigation

Desktop: Analytics | Workflow | Automation | Security. Mobile: stack the four items vertically. Use Flexbox and Media Query.

Pricing

FREE	PRO	ENTERPRISE
\$0	\$29/month	Custom
3 Projects Basic Analytics Community Support	50 Projects Advanced Analytics Automation Priority Support	Unlimited Projects Advanced Security Priority Support

The PRO card must be the visual focal point. Use flex-grow and flex-basis; do not use width: 150%.

Comparison table

	FREE	PRO	ENTERPRISE
Projects	3	50	Unlimited
Analytics	✓	✓	✓
Automation	✗	✓	✓
Advanced Security	✗	✓	✓
Priority Support	✗	✓	✓

On mobile, only the table itself may horizontally scroll. The body/page must not overflow.

04 — PAGE 03 / CONTACT

CONTACT AETHER Let's build something remarkable. First Name Last Name Email Company Budget Services Message [SEND REQUEST]	CONTACT INFORMATION Email hello@aether.com Phone +62 ... Address Jakarta, Indonesia Working Hours Monday – Friday 09:00 – 18:00
--	---

Form contract

- Inputs: text, email, select, radio, checkbox, textarea, submit.
- HTML validation: required, minlength, maxlength, type=email.
- No JavaScript. Empty/invalid forms must be blocked by native HTML validation.
- Desktop: First Name + Last Name and Email + Company share rows using Flexbox.
- Mobile: fields stack into one column.
- Input states required: normal, hover, focus, valid, invalid, disabled.
- Custom checkbox states must be created with CSS.
- FAQ must open/close without JavaScript; use an appropriate HTML element such as details/summary.

FAQ content: What is Aether? • How does Aether work? • Can I cancel anytime? • Do you offer enterprise plans? • How secure is the platform?

05 — CSS ARCHITECTURE & RESPONSIVE SYSTEM

CSS variables

Group	Minimum variables
Color	--color-background, --color-surface, --color-primary, --color-text, --color-muted
Spacing	--space-sm, --space-md, --space-lg, --space-xl
Radius	--radius-sm, --radius-md, --radius-lg

Responsive typography: use clamp() for hero h1, section h2, card h3, and body text. Typography must remain readable and must not overflow.

Global container: responsive, centered, max-width constrained, with horizontal padding. Use width, max-width, min(), calc(), and margin-inline.

Required test widths

320	375	480	600	768	900	1024	1280	1440
-----	-----	-----	-----	-----	-----	------	------	------

- Determine your own Media Query strategy; do not merely copy the listed widths as breakpoints.
- Decide when the navbar changes, hero becomes column, cards reflow, pricing stacks, form stacks, and footer becomes column.
- At 320px there must be no content overflow, clipped text, escaping buttons, image overflow, card overflow, form overflow, navbar overflow, or body horizontal scrollbar.

06 — FINAL BOSS / ENGINEERING TEST

Flex sizing challenge

Create three elements A, B, C with flex-grow values 1, 3, 1. Each uses flex-shrink: 1 and flex-basis: 200px.

Container	Required reasoning
700px	Explain how free/insufficient space affects the three flex items.
1000px	Explain how positive free space is distributed by grow factors.
500px	Explain what happens when the base sizes exceed the container.

Required written answers

1. What happens at 700px? 2. What happens at 1000px? 3. What happens at 500px? 4. When does flex-shrink begin to affect the layout?

Audit checklist

■ Semantic HTML	■ All links work and pages are connected	■ Forms have labels
■ Images have alt	■ flex-grow / flex-shrink / flex-basis	■ flex-wrap / justify-content / align-items
■ CSS variables / clamp() / calc()	■ Responsive at 320–1440px	■ No horizontal body overflow
■ No JavaScript	■ No Bootstrap	■ No Tailwind
■ No inline CSS	■ CSS separated from HTML	■ Consistent class naming
■ Hover works	■ Focus works	■ Native form validation works

Definition of Done

The project is complete only when all three pages are connected, the required sections and interactions work using native HTML/CSS behavior, the responsive layout survives the full test range, and no prohibited technology is used.

FINAL SUBMISSION

Submit the complete AETHER project folder with HTML, CSS, and asset files. The implementation should be clean enough to be reviewed as production-oriented front-end work.
